

WATERMART IRON AND SULFUR FILTRATION SYSTEM (DONE THE RIGHT WAY)

The most thorough way to remove iron and/or sulfur from your water. Period.

Having handled iron and sulfur issues for decades, we've discovered a 3-tiered approach works best (We do realize that this is contrary to many of the systems out there that claim to do it all in one step - which, by the way, we sell as well). However, nothing beats doing it right the first time: This solution will solve the problem perfectly, never require maintenance and will last and last and last.

STEP 1

Air injector: An air injector gets installed prior to your existing pressure tank. It adds air to your water and begins oxidizing the iron and sulfur into solids so that they can be easily filtered.

Dimensions: 5" long x 2 1/2" diameter

STEP 2

Contact tank with vent valve: A contact tank allows the air to spend time in contact with iron and sulfur and turn it into a filterable solid. It then releases any un-used air.

Dimensions: 53" high x 21" diameter

STEP 3

Self-cleaning Nextand filtration: This system filters out all the precipitated sulfur and iron from the water. Periodically, it will backwash and flush all the trapped iron and sulfur away. Rotten egg smells and red stains are now things of the past!

Dimensions: 58" high x 9" diameter

Call us for info and tips. We've been treating iron and sulfur for over 20 years!
